### The Logical Design of Data Warehouse

#### Case Study

Suitcase Incorporated sells a range of products to customer worldwide. You need to develop a data warehouse model based on the following requirements:

1. Its marketing division is interested in better understanding its customers. They want to slice-and-dice invoice revenue by customer and product to analyze product penetration and cross sell opportunities.

2. Sales management wants to better understand the performance of their sales organization in terms of both sales orders and invoice revenue - which sales representatives are selling and invoicing which customers for what products under which discount terms.

In addition to sales representative performance information, Sales is also interested in customer support cases. They want to understand which customers are experiencing product related support problems.

Finally, sales management wants the ability to better analyze forecast data. They'd like the ability to manipulate their sales forecasts by sales rep, product and customer characteristics.

3. Technical support currently has a stand-alone system for capturing customer support cases. However, the analytic capabilities are very limited. They would like the ability to analyze support cases by product, customer, and technician. They'd also like to access customer invoice revenue information in order to establish appropriate support case priorities.
